Mold & Machine Works Inc.

## Through The Wall Welder

Farmer multi-head automatic welders provide rapid change over and the ability to weld BCI group sizes U-1 through group 31 on our standard machine. Commercial and scrubber batteries can also be accommodated with minor modifications.

All of our welders incorporate Farmer's unique weld toggle assembly that has been proven in the industry for over 25 years. The weld head design allows greater force application at the weld point without compromising space. Our separate second squeeze application after the weld, forges the molten lead to an optimum pre-determined displacement within the punched hole in the container.

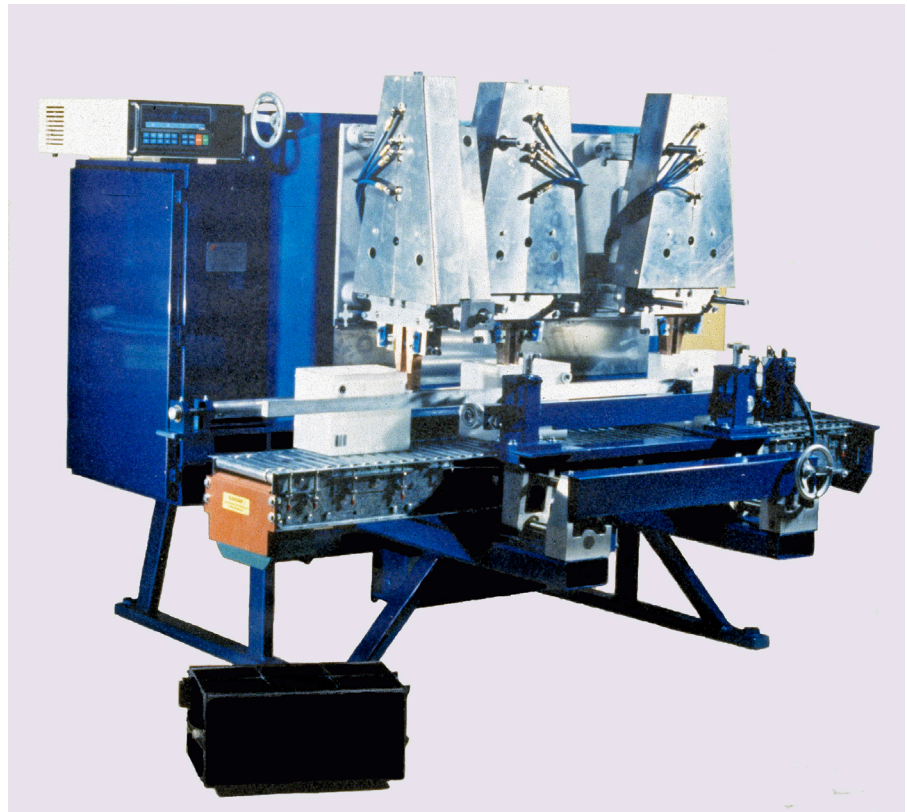

If your requirements are low volume or prototype runs, our single head welder provides a cost effective versatile welder.

The Farmer two head welder is a cost effective, highly reliable through the wall welder perfect for in line automotive and deep cell applications.

The Farmer three head welder is extremely versatile, allowing for automotive and deep cycle applications as well as a third head for industrial and truck battery applications.

*Battery Manufacturing Equipment & Tooling Since 1938*

### Features

- PLC Controls for production of up to 4 batteries per minute
- Long life belted conveyor system for low maintenance
- Proven material handling system for rapid changeovers.
- Low operating cost
- Unique second squeeze after the weld
- Variety of weld control options available

### Benefits

- Automatic short testing option
- Available in multiple configurations to suit individual customer needs
- Modular frame design with self contained hydraulic
- Touch Screen or Button Operator interface available
- Weld Control Data Collections option available.
